

## 2002 Winter Bird Survey Results

The American goldfinch was seen in the greatest numbers during the count, however, northern cardinals were found at the greatest number of feeders (just not in large numbers). Common grackles were only found at about 30 feeders, but several observers reported very large numbers. House finches continue to grow in abundance.

The following is a list of the 20 most commonly seen species during the 2002 Winter Bird Feeder Survey.

American Goldfinch - 3,108  
House Sparrow - 2,587  
Northern Cardinal - 1,704
